

Hello, I'm Joshua. I'm a native of Golden, Colorado, and I've spent most of my life in the Denver area, where I enjoy exploring, spending time with friends, and attending school.

My journey into the tech world began in high school when I joined an election campaign. I dedicated nearly a year to data analysis, handling long lists of almost 3000 items every other day. My responsibilities included deciphering support rates and assisting the campaign in developing a winning strategy. It was during this time that I recognized that there was a significant connection between our political work and programming when a friend of mine fixed a bug on our candidate's website that had plagued the team for nearly a week.

Following the campaign, I made the decision to pursue Computer Science full-time. I dedicated a quarter of a year to self-study before starting my first year at the University of Colorado Denver. Now, I am in my second year and I am excited to learn more and develop my skills further. Throughout my year-and-a-half journey, I've developed a diverse skill set that spans frontend and backend development. Right now, my primary focus is on frontend development and creating clean, intuitive websites that are easily maintainable and make the client happy.

If my skills and qualifications align with your expectations, don't hesitate to reach out. I am available to respond to your emails and calls and can answer any questions you have. Thank you for taking the time to consider me and I hope to hear back from you soon.
